

ABSTRACT OF THE DISCLOSURE

Oral treatment devices include a barrier layer and an oral treatment composition, and optionally an auxiliary adhesive composition, that acts as an endoskeleton so as to at least partially contribute to maintaining the barrier layer in the shape of a dental tray, or in a tray-like configuration, prior to use. The barrier layer protects the oral treatment and/or adhesive composition from saliva or moisture during use. The treatment and/or auxiliary adhesive compositions can have a consistency ranging from a sticky, viscous gel or a solid. They preferably include a tissue adhesion agent comprising a hydrophilic polymer.
